

[Standard Document] EV424: The Global Integrity Protocol (SSOT v1.3) — Safe-Rail Addendum (EN)

Issued: 2026-02-06 21:45 KST

Purpose: IR / Whitepaper / Global Partnership / Trust-Layer Standard

Scope: Integrity-only. The Non-Negotiable Boundary MUST remain unchanged across all official materials.

### Non-Negotiable Boundary

EV424 DOES: Byte-level sameness (Same Bytes    Same SHA-256) · Non-custodial (not stored/mirrored/hosted)

Open reproducibility (independent verification possible with the receipt alone).

EV424 DOES NOT: It does not judge truth/safety/legality · It does not analyze content or provide compliance or enforcement

It does not take custody or host original files.

### Revenue Safe-Rails

Consulting: Integrity Architecture Design (process, artifacts, and re-verification loops — not content judgment).

API & per-transaction: Receipt issuance infrastructure. Each call produces a verifiable sameness event; it never expires.

Ecosystem program: Conformance for process/format/independent verification. Use terms like EV424 Ready or EV424 Compliant.

### Safe-Rail 2.0 (3 fixed statements)

#### A. Business

We do not review what the data says. We only prove it is still the same, and we offer that verification infrastructure.

#### B. Technical

EV424 does not judge. It only reproduces. We do not claim truth; we issue integrity receipts that any third party can verify.

#### C. Legal boundary

A PASS on an EV424 receipt is not an approval of legality. It is a mathematical confirmation of byte-level sameness.

### Immutable Boundary Notice (must be attached to API/receipt)

This receipt attests byte-level sameness only. It does not judge truth, safety, or legality.

The source is referenced, not mirrored.

### Final Attestation

EV424 does not judge truth or safety. It attests sameness with reproducible receipts.
